f-strings python 3.6 and above

```
name, age = "Paul" , 49
print( f"Hello I am {name}. I am {age}." )
#Hello I am Paul. I am 48.
```

```
print (f"{2 * 5}") #10
```

```
print(f"{name.lower()} is lowercase.")
#paul
```

```
d= 10.1294
print( f"£{d:.2f}" ) #£10.13
```

f-Strings

f-Strings

f-Strings provide a convenient way to format strings. Prefix your string with 'f'. You can then embed values using {}. Uses are for variables, simple calculations, and formatting outputs.
