

3

```
text = "Hello World!"
```

```
print(text[:5])  
#Hello
```

```
print(text[6:])  
#world
```

```
print(text[2:7])  
#llo W
```

String Slice

Slicing Strings

You can return a portion of a string using the slice notation. [:] This uses the start and end index. You can omit the start or end number for example to get all the characters up to index 5 - "Hello"
