3

```python
person = {
    "name": "Paul",
    "Job": "Teacher",
    "Age": 49
}

print(person)
#{'name': 'Paul', 'Job': 'Teacher', 'Age': 49}
print(person["name"])
#Paul
```

Dictionary

Python Dictionary

A Dictionary is used to store data in Key - Value pairs. The data cannot have duplicates. Data is accessed through using the keys to retrieve the values. Additional keys can be added and values can be changed/
